Trend Jumper
Special Tactics for the EURUSD Daily Swingtrade Plan

Tradeplan Details and Rules (Please note that the YM trades in 1 point increments. The word 'ticks' and 'points' are used interchangeable in this manual and are both referring to the minimum price movement of the YM)

The Trend Jumper is based on pure price action. This tradeplan and approach uses a very specific Trend Jumper trade setup called "The Crossover Trade." The Crossover Trade is designed to take advantage of price action turning points.

It is highly recommended that you manually backtest a few months worth of trades prior to trading it live. In fact, as we teach in our typical Trend Jumper Training, we also strongly suggest that you prove you can execute the plan as intended, by making 25 consecutive mistake free trades in a sim account before committing real money.

Indicators
- Jumpline (red dotted line)
- Confirmation line (white solid line)
- Trailing Indicator (blue solid line)
- 30 EMA
- Trend Jumper EURUSD Swingtrade Calculator

The Crossover Trade (See video for examples)
- The Confirmation Line (white) crosses over the Jumpline (Red dashed)
    - For longs, it crosses over from below to above. The first green bar that also closes above the Jumpline is the Setup bar to go long. Both the Confirmation Line and the Green Price Bar must CLOSE above the Jumpline for the setup to be valid.
    - For shorts, it crosses over from above to below. The first red bar that also closes below the Jumpline is the Setup bar to go short. Both the

Confirmation Line and the Red Price Bar must CLOSE below the Jumpline for the setup to be valid.

- o Dojis DO count as setup bars

- The setup is cancelled if the Confirmation Line (CL) closes back, on the opposite side prior to the entry being hit. That means for a long trade, if the CL closes below the Jumpline (JL), then the long trade is cancelled and vice versa for shorts.
- When the entry is hit, the trade is considered live and must be managed to its completion.
- The Entry is 2 ticks above the high of the setup bar for longs and 2 ticks below the setup bar for shorts. We also make key level adjustments to our entries as described below.
- The Stop is 1 tick below the low of the setup bar, plus or minus key level adjustments.

Targets

- Targets are dynamic to the current volatility of the market. Sometimes they will be small, other times they will be larger.
- Because this is designed to be a multi-position approach, even small setups can turn into large gains.
- Below, in the Trade Management Section, it is explained how and when to take profits, as well as activate trade management maneuvers.

Adjustments

- This particular swingtrade plan doesn't really call for key level adjustments although you may want to make them. Please refer to the Trend Jumper YM 5 Minute Chart Tradeplan for a detailed description of the key level adjustments we like to make.
- As explained in the video, I like to round the 5th digit, fractional pip (tick), away from my entries and stops and closer on my targets. If an entry is at 1.30028, for example, or even 1.30022 for that matter, I will adjust the entry up to 1.3003. If it were the stop, I would adjust it further away.
- Always add spread to the buy side of the trade. For longs, add it to the entry. For shorts, add it to your exits.

EURUSD End of Day (Daily Chart) Swingtrade Management Rules

- This trade plan can be traded with one, two or three positions. It was ideally designed to be a THREE position approach. NEVER put more than 2% risk on any given trade. If you have a smaller account, trade one position. Add the other positions as your account grows.
- Take the first position off at the 2nd target for the standard approach
- Trail the 2nd position
- Optional: You can take part of your position off at the 1st, 2nd and 3rd targets and then trail the remainder. This is actually what I like to do but just make sure you are adequately capitalized and are sticking to the 2% risk per trade requirement.
- Entries are 11 pips above (longs) or below (shorts) the setup bar
- Stops are 47 pips above or below the setup bar
- If you platform shows Sunday bars, please ignore them. Sunday setup bars are not part of this tradeplan.
- To activate the trailer, measure the distance between the entry and the 1st target. 10% of that distance PAST the first target is when you want to begin using the Trailing Indicator to either cut risk or lock in profit.
- Continue trailing based on each closing bar. If long, every time a bar closes ABOVE the Jumpline, take the reading from the data window and place your stop two PIPs below the Trailing Indicator (TI). The TI is a slower Jumpline so make sure you are reading the right one in the data window.
- If and when you get 95% of the 2nd target (from the entry) lock in 100 pips on your entire position unless the TI has even more locked in. Go with whichever locks in the most at that time. This is called 'trading for profit.' We do not want to give back all our hard earned gains when we've gone 95% of the way but we still want to give the trade a chance to go the full distance if we can. Locking in a 100 pips is an effective compromise.
- Watch the training video for greater insight into this tradeplan
